INTRODUCING XSWATCH, The XS Applied Technologies' 24-Hour Live Monitor. Designed to help keep your IT systems stable and secure, XSWATCH keeps your systems up and running by monitoring every aspect of your IT infrastructure – from your computers and servers to your network appliances and software. XSWATCH uses heuristic analysis and intuitive threat detection, in conjunction with customizations and established thresholds and policies to ensure that your most critical assets are always protected.

XSWATCH allows us to establish customizable thresholds to alert us when your devices are low on hard drive space and memory so that we can take action before it's too late.

XSWATCH will protect your device from permanent damage by notifying us when processor usage exceeds thresholds established by us based on your users' individual needs.

XSWATCH helps us eliminate unnecessary data loss by notifying us when device disks report SMART errors allowing us time to ensure that data is backed up before disk failure.

XSWATCH alerts us when antivirus software is needed, disabled, or is not up to date. It also alerts us when Windows Updates are disabled. It also includes advanced malware protection and automatically updates definitions.

XSWATCH creates and monitors event logs to help you track historical data. It can also search for specific events and notify us when an event is discovered. It even tracks Windows services and will alert us if a service stops running.

XSWATCH will notify us if your device firewall has been disabled to prevent the possibility of incursion.

XSWATCH detects if your device goes offline and lets us boot it up remotely.

HERE'S THE BEST PART... XSWATCH IS INCLUDED WITH YOUR XS MANAGED SUPPORT AGREEMENT - THERE'S NO ADDITIONAL FEE!
