

TECH-TIMELINE

XS Applied Technologies is born!

The 1990's Conference Room
Apart from the drab décor with ZERO design sense, the conference room of the 90's featured projectors that required a dimly lit room and a connected telephone.

The 2000's Conference Room
In addition to finding a sense of style, the millennial conference room also found plasma TVs to replace the projector and allow participants to work in a lit room – imagine being able to take notes, pour yourself a cup of coffee and see the colleague sitting to your right! The telephone was also replaced with unidirectional tabletop mics and in-wall speakers. Business phone systems now have multiparty conference bridges for Remote Participants.

The XS Conference Center
Today's Conference Room is a hub of collaboration and participation. What's more is the absence of clutter from wiring and hardware. XS Applied Technologies brings the hands-free world of mobile technology into the conference center by reducing the appearance of equipment like microphones and speakers, and eliminating the need for cabling by integrating ceiling mounted microphone arrays, in-wall and in-ceiling speakers, and wireless access points. We've also replaced the Plasma and LCD TVs with Ultra-High Definition Interactive Whiteboards. Onsite and Remote Participants can now be engaged in true collaboration without having to worry about taking notes as meetings are now recorded and streamed, and interactive whiteboard presentations can be captured and shared on-demand by connected participants. They can even interact with the whiteboard without leaving their seats or homes.
