- XS Applied Technologies vast experience in a variety of technology disciplines; our broad range of offerings makes us the only managed service provider you will need for all your business technology needs.
- We constantly seek out ways that we can not only improve your operations, but ours as well, even if that means having to adapt change. We work with you to customize solutions that align with your business goals and technology needs.

CASE STUDY

A New York City based distributor of bullion coins and pure investments bars was experiencing problems with its infrastructure that was hindering its growth. High latency issues prevented them from having accurate values for precious metals and rare coins since prices fluctuated frequently. They were also relying on an out-of-date phone system. While in the process of making upgrades, Hurricane Sandy destroyed everything. After the storm, XS Applied Technologies scoured the region to find the technology required for our customer to get its business up-and-running again. Within four business days, our customer had a temporary office with computers, monitors, servers, and a new telephone system. We added resiliency by

replicating its premise-based servers to virtual machines on physical servers located in the Midwest to further protect important data. XS also introduced fiber connectivity to decrease latency and improve the accuracy of pricing of precious metals and rare coins on the market. And with the new IP phone system in place, the company now have an infrastructure that will scale with it.

The upgrades made to our client's infrastructure allows for faster and more accurate valuation of the market. The company now has employees working remotely on the west coast with a greater ability to trade on foreign markets. We are happy to continue servicing and finding solutions to our client's technology needs as they grow.
